## 1 Summations

#### 1.1 Arithmetic Series

Let  $(a_i)_{i\geq 0}$  be an arithmetic sequence with common difference d. Then for some  $n\in\mathbb{N}$ ,

$$\sum_{i=0}^{n} a_i = \frac{(n+1)(a_0 + a_n)}{2}.$$
 (1)

*Proof.*  $\exists$  – Real.Arithmetic.sum\_recursive\_closed

Let  $(a_i)_{i\geq 0}$  be an arithmetic sequence with common difference d. By definition, for all  $k\in\mathbb{N}$ ,

$$a_k = (a_0 + kd). (2)$$

Define predicate P(n) as "identity (1) holds for value n." We use induction to prove P(n) holds for all  $n \ge 0$ .

Base Case Let k = 0. Then

$$\sum_{i=0}^{k} a_i = a_0 = \frac{2a_0}{2} = \frac{(k+1)(a_0 + a_k)}{2}.$$

Therefore P(0) holds.

**Induction Step** Assume induction hypothesis P(k) holds for some  $k \geq 0$ . Then

$$\sum_{i=0}^{k+1} a_i = \sum_{i=0}^{k} a_i + a_{k+1}$$

$$= \frac{(k+1)(a_0 + a_k)}{2} + a_{k+1} \qquad \text{induction hypothesis}$$

$$= \frac{(k+1)(a_0 + (a_0 + kd))}{2} + (a_0 + (k+1)d)$$

$$= \frac{(k+1)(2a_0 + kd)}{2} + (a_0 + (k+1)d)$$

$$= \frac{(k+1)(2a_0 + kd) + 2a_0 + 2(k+1)d}{2}$$

$$= \frac{2ka_0 + k^2d + 4a_0 + kd + 2kd + 2d}{2}$$

$$= \frac{(k+2)(2a_0 + kd + d)}{2}$$

$$= \frac{(k+2)(2a_0 + kd + d)}{2}$$

$$= \frac{(k+2)(a_0 + a_0 + (k+1)d)}{2}$$

$$= \frac{(k+2)(a_0 + a_{k+1})}{2}$$

$$= \frac{((k+1) + 1)(a_0 + a_{k+1})}{2}.$$
(2)

Thus P(k) implies P(k+1) holds true.

**Conclusion** By mathematical induction, it follows for all  $n \geq 0$ , P(n) is true.

#### 1.2 Geometric Series

Let  $(a_i)_{i\geq 0}$  be a geometric sequence with common ratio  $r\neq 1$ . Then for some  $n\in\mathbb{N}$ ,

$$\sum_{i=0}^{n} a_i = \frac{a_0(1-r^{n+1})}{1-r}.$$
(3)

 $Proof. \exists - Real.Geometric.sum\_recursive\_closed$ 

Let  $(a_i)_{i\geq 0}$  be a geometric sequence with common ratio  $r\neq 1$ . By definition, for all  $k\in\mathbb{N}$ ,

$$a_k = a_0 r^k. (4)$$

Define predicate P(n) as "identity (3) holds for value n." We use induction to prove P(n) holds for all  $n \ge 0$ .

Base Case Let k = 0. Then

$$\sum_{i=0}^{k} a_i = a_0 = \frac{a_0(1-r)}{1-r} = \frac{a_0(1-r^{k+1})}{1-r}$$

Therefore P(0) holds.

**Induction Step** Assume induction hypothesis P(k) holds for some  $k \geq 0$ . Then

$$\sum_{i=0}^{k+1} a_i = \sum_{i=0}^{k} a_i + a_{k+1}$$

$$= \frac{a_0(1 - r^{k+1})}{1 - r} + a_{k+1} \qquad \text{induction hypothesis}$$

$$= \frac{a_0(1 - r^{k+1})}{1 - r} + a_0 r^{k+1}$$

$$= \frac{a_0(1 - r^{k+1}) + a_0 r^{k+1} (1 - r)}{1 - r}$$

$$= \frac{a_0(1 - r^{k+1} + r^{k+1} (1 - r))}{1 - r}$$

$$= \frac{a_0(1 - r^{k+1} + r^{k+1} - r^{k+2})}{1 - r}$$

$$= \frac{a_0(1 - r^{k+2})}{1 - r}$$

$$= \frac{a_0(1 - r^{(k+1)+1})}{1 - r}.$$

Thus P(k) implies P(k+1) holds true.

**Conclusion** By mathematical induction, it follows for all  $n \geq 0$ , P(n) is true.
